Altered Mental Status

History

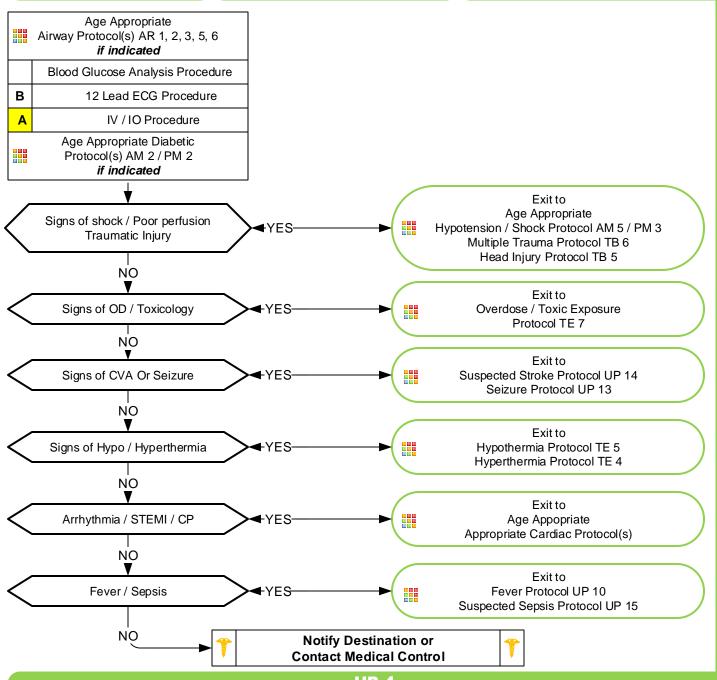

- Known diabetic, medic alert
- Drugs, drug paraphernalia
- Report of illicit drug use or toxic ingestion
- Past medical history
- Medications
- History of trauma
- Change in condition
- Changes in feeding or sleep habits

Signs and Symptoms

- Decreased mental status or lethargy
- Change in baseline mental status
- Bizarre behavior
- Hypoglycemia (cool, diaphoretic
- Hyperglycemia (warm, dry skin; fruity breath; Kussmaul respirations; signs of dehydration)
- Irritability

Differential

- Head trauma
- CNS (stroke, tumor, seizure, infection)
- Cardiac (MI, CHF)
- Hypothermia
- Infection (CNS and other)
- Thyroid (hyper / hypo)
- Shock (septic, metabolic, traumatic)
- Diabetes (hyper / hypoglycemia)
- Toxicological or Ingestion
- Acidosis / Alkalosis
- Environmental exposure
- Pulmonary (Hypoxia)
- Electrolyte abnormality
- Psychiatric disorder

Altered Mental Status

Pearls

- Recommended Exam: Mental Status, HEENT, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro.
- AMS may present as a sign of an environmental toxin or Haz-Mat exposure protect personal safety.
- General:

The patient with AMS poses one of the most significant challenges.

A careful assessment of the patient, the scene and the circumstances should be undertaken.

Assume the patient has a life threatening cause of their AMS until proven otherwise.

Pay careful attention to the head exam for signs of bruising or other injury.

Information found at the scene must be communicated to the receiving facility.

• Substance misuse:

Patients ingesting substances can pose a great challenge.

DO NOT assume recreational drug use and / or alcohol are the sole reasons for AMS.

Misuse of alcohol may lead to hypoglycemia.

More serious underlying medical and trauma conditions may be the cause.

Behavioral health:

The behavioral health patient may present a great challenge in forming a differential.

DO NOT assume AMS is the result solely of an underlying psychiatric etiology.

Often an underlying medial or trauma condition precipitates a deterioration of a patients underlying disease.

• Spinal Motion Restriction / Trauma:

Only utilize spinal immobilization if the situation warrants.

The patient with AMS may worsen with increased agitation when immobilized.

- It is safer to assume hypoglycemia than hyperglycemia if doubt exists. Recheck blood glucose after Dextrose or Glucagon
- Consider Restraints if necessary for patient's and/or personnel's protection per the restraint procedure.
